**DESCRIPTION**

These devices are analog multiplexer demultiplexers in high speed silicon gate C<sup>2</sup>MOS technology and they are pin compatible with the equivalent metal gate CMOS "4000B" series. These analog switches are bidirectional and digitally

controlled.

A built-in level shifting is included to allow them an input range of up to  $\pm 6V$  (peak) for an analog signal with digital control signal of 0 to 6V.

$V_{EE}$  supply pin is provided for analog input signals. They have an inhibit (INH) input terminal to disable all the switches when high. For operation as a digital multiplexer/demultiplexer,  $V_{EE}$  is connected to GND.

## DESCRIPTION

The HC4051 is a single 8 channel multiplexer demultiplexer having three binary control inputs A, B and C to select 1 of 8 to be turned on, and connected to the output.

The HC4052 has a pair of four channel multiplexer demultiplexer having two control inputs A and B that

select one of four channels of the two sections.

The HC4053 is a triple two channel multiplexer demultiplexer having three separate digital control inputs A, B and C to select independently one of a pair of channels.
